

Introduction to KNIME

<https://chinadatalab.net>

Presenter: Tao Hu and Lu Chen, and Shuming Bao

Date: 2019-11-21

Outline

- ① workflows software KNIME introduction
- ② text data literature analysis case study
- ③ enterprise data financial data analysis case study
- ④ government statistics higher education spatiotemporal analysis case study
- ⑤ machine learning industry agglomeration analysis case study
- ⑥ workflow data analysis case study production guide

科研与教学资源集成平台

- **数据共享：**

- 授权使用数据 Licensed data
- 有限共享数据 Restricted data
- 敏感数据 Sensitive data
- 大数据 Large size data
- 科研项目产生数据 Research data generated from different projects

- **软件共享：**

- 免费与授权软件共享
- 加强软件与数据结合
- 解决硬软件兼容问题
- 减少本地维护与更新成本

- **科研成果共享**

- 科研（可重复、可复制、可扩展）
- 教学（适应不同专业兴趣与技能）
- 其他应用（高效、易学、可扩展）

KNIME 简介

<https://www.knime.com>

The screenshot displays the KNIME Analytics Platform interface. On the left, the 'KNIME Explorer' shows a project tree with folders like 'LOCAL: Local Workspace' and 'Case Studies'. A red box highlights the 'High Education' folder, with the text '工作目录' (Working Directory) overlaid. Below it, the 'Node Repository' is visible, with a red box highlighting various node categories, and the text 'Node工具包' (Node Toolset) overlaid. The central 'Workflow Canvas' shows a workflow with nodes: 'Shapefile Point Reader' (Node 1), 'R Snippet' (Node 2), 'Column Filter' (Node 3), 'Transpose' (Node 4), 'Java Snippet (Snippet)' (Node 5), 'Java Snippet (sample)' (Node 6), 'Shapefile Polygon Reader' (Node 13), 'Column Filter' (Node 14), 'Joiner' (Node 11), 'Constant Value Column' (Node 16), and 'Java R (Table)' (Node 10). A red box highlights the central workflow area, with the text '工作流创建区' (Workflow Creation Area) overlaid. At the bottom, the 'KNIME Console' shows system messages, and the 'Description' panel on the right shows details for a 'High Education' node, including title, description, tags, links, creation date, and author.

Input and Output

Input/Output	Category	Data Format
❑ Input Data	• Local File Reader	Excel; CSV; Table; PMML; Images; File; etc.
	• Database Connector	MySQL; SQLite; PostgreSQL; H2; SQL Server; etc.
	• Big Data Connector	HDFS; webHDFS; HttpFS; HDFS; Hive; etc.
	• Spatial Data Reader	Shapefile Point; Shapefile Polygon; GeoJSON; WFS Connector;
❑ Output Data	• Local File Writer	Excel; CSV; Table; PMML; Images; File; etc.
	• Database Connector	MySQL; SQLite; PostgreSQL; H2; SQL Server; etc.
	• Big Data Connector	HDFS; webHDFS; HttpFS; HDFS; Hive; etc.
	• Spatial Data Writer	Shapefile; GeoJSON; Map Viewer

KNIME Hub 交换中心

The image displays a browser window showing the KNIME Hub search results for '02_Geographic_Analysis'. The search results list several workflows, with '02_Geographic_Analysis' selected. The workflow preview shows a 'Table Reader' node connected to several other nodes: 'Cities', 'WorldData', 'MISSING OSM Map View', 'Aggregated by city', 'Heatmap World Cities', 'Choropleth World Map', 'Image to Report', 'Aggregate by Country', 'Data to Report', 'Top 5 Countries', and 'MISSING OSM Map View'. A yellow box highlights the 'Geographic Analysis' description: 'This workflow visualizes a set of points on a world map through their latitude and longitude coordinates using the KNIME Open Street Map integration and the R graphic libraries.'

Going public in China: Reverse mergers versus IPOs

Aim: This study examines the decision to go public in China through an initial public offering (IPO) versus a reverse merger (RM) transaction.

Journal of Corporate Finance
Volume 58, October 2019, Pages 92-111

Abstract

We study firms that go public through reverse mergers (RMs) versus **initial public offerings** (IPOs) in China. Using a manually assembled data set, we show that pre-listing RM firms are larger, more profitable, and less politically connected than pre-listing IPO firms. Chinese RM firms also have superior post-listing performance, in terms of both operations and **stock returns**, compared to IPOs matched on industry and size. Unlike IPOs, RM firms do not underperform the market in the long run. These results are in sharp contrast to the evidence on RMs from **developed countries**. We trace these differences to China's stringent and potentially biased IPO policies, which appear to preclude even high-quality firms from accessing public markets.

Highlights

- We study firms' choice to go public through reverse mergers (RMs) versus initial public offerings (IPOs) in China.
- Pre-listing RM firms are larger, more profitable, and less politically-connected than pre-listing IPO firms.
- RM firms also have superior post-listing performance, both in terms of operations and stock returns.
- These results are in sharp contrast to the evidence on RMs from developed countries.

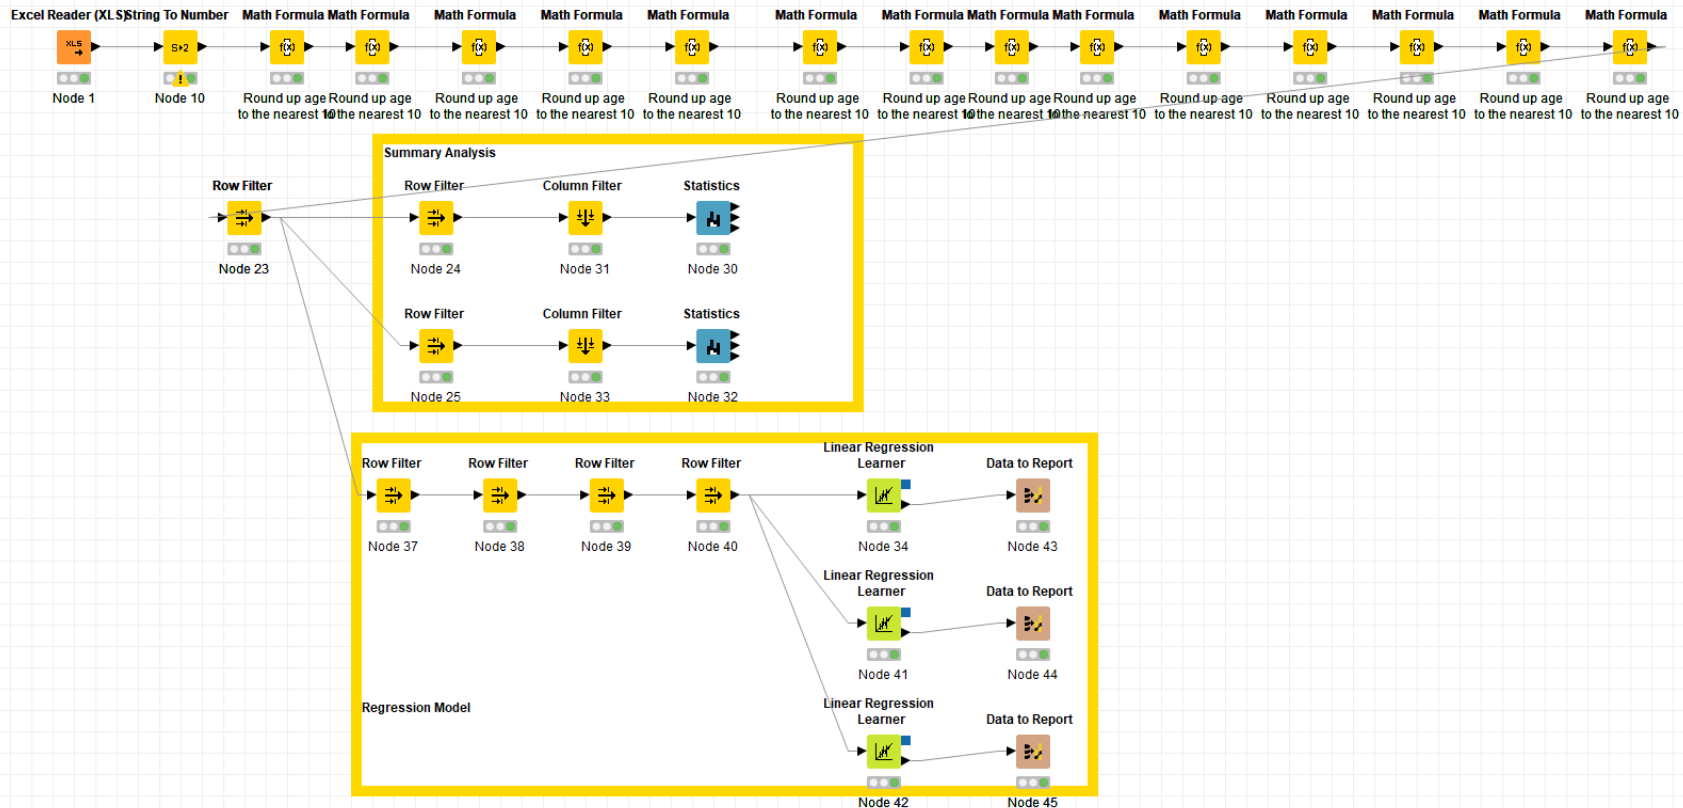

Data Sources 数据来源

Name	Format	Description
IPO.xlsx	xlsx	The financial and stock returns data of listed firms are from the China Stock Market and Accounting Research (CSMAR) Database
RM.xlsx	xlsx	The data is from the iFinD database provided by Tong Hua Shun (THS), a major financial data service company in China
Firm.xlsx	xlsx	The financial information on each RM proposal from www.cninfo.com.cn , a CSRC-authorized website that archives documents and filings for listed firms

Background 背景

Aim: Study spatiotemporal distribution patterns and its changes of China's higher education resources by visualizing the education indicator and applying spatial autocorrelation analysis.

Related work from previous studies:

- Mainly focus on single indicator to analysis
- Basically use mathematical statistics methods

Expansion by this study:

- ✓ Multiple indicators involved
- ✓ Spatial statistics analysis

Study Area:

- ✓ All universities in China.

Data Sources 数据来源

Data Category	Data Description		Data Source	Software
High education resources of each province	Number of universities	2003、2007、2011、 2015	China statistical yearbook	Excel
	Education funding			
	Number of students			
	Number of full-time teachers			
Map of China	With province boundary		Public data	ArcGIS

Flow Chart 数据分析流程图

To calculate the Education Indicator:

According to paper[1], we get weights of 4 single indicators of 4 years. The average value of weights in 4 years will be the final weight for each single indicator.

Objectives 目标

❑ Research Background

As an important form of industrial spatial distribution, it is an urgent and challenging problem to study the measurement and influencing factors of industrial co-agglomeration, especially at the level of urban cluster.

❑ Research Aim

Accurate measurement of industrial co-agglomeration index, especially the direction of industrial co-agglomeration.

Definitions

❑ **Definition of Industrial Co-agglomeration**

Industry locate near one another OR agglomeration across industries as a whole (Ellison et al., 2010)

❑ **The peculiarity of industrial co-agglomeration: Directionality Based on Ecology Theory**

❑ **Commensalism:** a long-term biological interaction (symbiosis) in which members of one species gain benefits while those of the other species neither benefit nor are harmed.

❑ **Protocooperation:** a form of mutualism, but the cooperating species do not depend on each other for survival.

❑ **Mutualism:** the ecological interaction between two or more species where each species has a net benefit.

Data Sources 数据来源

- 2013 China industrial enterprise database
- Use the Baidu API to get enterprise geographic latitude and longitude
- Classified according to Chinese urban clusters

Name	Format	Description
Enterprise data	csv	Enterprise longitude Enterprise latitude Industry code Cluster code
Selected industry list	csv	The selected industries code

Steps of Data Analysis 数据分析步骤

Step1: Calculate the Wasserstein Distance of spatial distribution between two industries

$$W_{j,k} = \left(\inf_{\gamma \in \Gamma(f_j, f_k)} \int_{\square^2 \times \square^2} d(x, y)^2 d\gamma(x, y) \right)^{1/2}$$

Step2: construct our counterfactual of randomly located (pseudo) industries

Null hypothesis: no spatial similarity between industry j and industry k conditional on the spatial density of industry j

1000 pseudo industries to generate an empirical null distribution for colocalization of industry j to pseudo industry \hat{k}

We construct our colocalization index by determining the number of pseudo industries for which $W_{j,k}$ is less than $W_{j,\hat{k}}$

Religious Diversity and Regional Development

Aim: Test the impacts of religious diversity on regional development in China

Findings from previous studies: Religious diversity may have positive or negative impacts on economic development

Background of this study: Test the impacts of religious diversity on regional development under the same political regime at sub-national level (province) in a peaceful environment

Data Sources 数据来源

Name	Format	Description
Data_religion.xlsx	xlsx	The number of religion sites of different types at different provinces from 1987 to 2004
Data_statistics.xlsx	xlsx	variables included in the regression analysis, including real income per capita, average education attainment, investment in physical capital, policy variable, Growth rate of labor & tech, dep.
province_boundary.shp	shp	the boundaries of provinces in mainland China

Methodology 方法

Measurements of religious diversity: fragmentation and polarization indices

Fragmentation:
$$FRAG_i = 1 - \sum_{j=1}^J \left(\frac{n_{ij}}{N_i} \right)^2$$

Polarization:
$$POL_i = 1 - \sum_{j=1}^J \left(\frac{0.5 - \pi_{ij}}{0.5} \right)^2 \pi_{ij}$$

Regression:
$$\ln \frac{Y(t)}{L(t)} = \beta_0 + \beta_1 \ln s_k + \beta_2 \ln s_h + \beta_3 (n + g + \delta) + u$$

Moran I test for spatial autocorrelation:
$$I(d) = \frac{\sum_i^n \sum_{j \neq i}^n w_{ij} (x_i - \bar{x})(x_j - \bar{x})}{S^2 \sum_i^n \sum_{j \neq i}^n w_{ij}}$$

Conclusions and Discussions 结论和讨论

- ❑ The results from the panel data regressions within national coverage suggest that the religious diversity has positive and significant impacts on regional development in general.
- ❑ The results from the panel data regressions within regional coverage suggest that religious fragmentation has a positive and significant association with the economic development in the eastern region of China while religious polarization has a positive and significant association with the economic development in the central and western regions of China.

案例学习与研发流程

- ❑ Step 1: Get familiar with the workflow tool
- ❑ Step 2: Practice with the sample work of case studies
- ❑ Step 3: Find a published paper and define the flowchart of data analysis
- ❑ Step 4: Develop the workflow with tool
- ❑ Step 5: Prepare the PPT report
- ❑ Step 6: Make the presentation
- ❑ Step 7: Finalize the case study
